Data Matching

Results

Summary

- A *feed-forward*, open-loop correction dramatically increases the closed-loop response of the servo system
- This correction is based on the DM stiffness matrix . . .
- . . . operatively defined by arbitrarily displacing one actuator, while all the others are constrained at 0, and calculating the reaction forces
- The *influence function* (IF) is the shape of the DM when poking a single actuator

Introduction

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

Many advantages and a basic requirement

OPTICAL DATA \Leftarrow MATCHING \Rightarrow FEA

Already demonstrated for LBT and VLT **mirror local stiffness**

[Del Vecchio et al., 2013]

- Expanding the method to the whole DM allows
 - get rid of obscurations
 - avoid complex data processing @ edges
 - easier calibration

provided that the FEA matches the experimental data

Images vs Simulations

- optical calibration \leftarrow 1170 Influence Functions

$$\bullet \text{ IF}_i = \text{image of } w_k = \begin{cases} 0 & \text{if } k \neq i \\ w^* & \text{if } k = i \end{cases}$$

- the actuator is moved until the set point via the *capsens* reading (close loop)
- the *capsens* signal is converted from an average capacitance signal, lower than the actual magnet position
- the real IF deformation field differs from the actuation command in the FEM
- a suitable operator makes the transformation

The Simulation I

The actual capsens implies too large models

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

- $$C = \int_0^{2\pi} \int_{r_i}^{r_o} \frac{\varepsilon}{z(r, \theta)} r dr d\theta = \frac{\varepsilon A}{z^*}$$
- $$\frac{1}{z^*} = \frac{1}{A} \int_0^{2\pi} \int_{r_i}^{r_o} \frac{1}{z(r, \theta)} r dr d\theta$$
- Taylor expansion of $\frac{1}{z}$ around $r^* \forall \theta$
- $$r^* = \frac{2}{3} \frac{r_o^2 + r_i^2 + r_o r_i}{r_o + r_i}$$
 minimizes the error

The Simulation III

Modelling tricks

AdOpt IF

Del Vecchio
et al.

Rationale

Background

Introduction

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

- insert 1170 circumferences of radius r^*
- mesh them with only 22 triangles (*Delaunay method*)

AdOpt IF

Del Vecchio
et al.

Verifying the r^* approximation on two VLT actuators

8 @ (0.063,0) (*edge*)
error < 3.5%

312 @ (0.291,0) (*central*)
error < 1%

Interferometric
Data

Data Matching

Results

Summary

Experimental IFs

Interferometric data sets \rightsquigarrow mirror deformation map

HOW THE IF DATA ARE COLLECTED

- displacement $+c$ applied to the i th actuator (an image w_1 is captured)
- displacement $-c$ applied to the i th actuator (an image w_2 is captured)
- repeating these steps N times, $2N$ frames are obtained

- resulting image:
$$w_m = \frac{1}{N} \sum_{i=1}^N \frac{(w_{i1} - w_{i2})}{2c}$$

Processing the Interferometric Data II

Interferometric Data

AdOpt IF

Del Vecchio
et al.

Rationale

Background

Introduction

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

FRAME RATE = 25 Hz

EACH w_m FRAME IS CORRECTED FOR TIP-TILT AND
DEFOCUS

PISTON ADJUSTED SO THAT $|w_m| = 0$ AFTER MASKING THE
IF PEAK

w_m IS FINALLY NORMALIZED TO UNITARY MAXIMUM VALUE

Image noise = .014

Given by the convection residuals, it's computed as the
RMS of the images after masking out the actuated region
to be compared with the unitary IF peak value

Data Matching I

FEM $\xleftrightarrow{\text{consistency}}$ Image

AdOpt IF

Del Vecchio
et al.

Rationale

Background

Introduction

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

- $\mathbf{F}_m \xrightarrow{\mathbf{M}} \mathbf{F}_c$
 - \mathbf{F}_m = model IF data (actuator displaced at the magnet locations)
 - \mathbf{F}_c = image (actuator displaced at the capacitive sensor ones)
 - $\mathbf{M} = n_{act} \times n_{act}$ transformation matrix: $\mathbf{M}(i, j)$ = value of $\mathbf{F}_m(i, j)$ (i th IF, j th actuator) averaged over the capacitive sensor ring as mapped on \mathbf{F}_m
- $\mathbf{F}_c = \mathbf{M}^{-1} \mathbf{F}_m$
- each \mathbf{F}_c image is finally
 - re-aligned to match the interferometer images geometry
 - normalized to unitary maximum value
- As a result, \mathbf{F}_c and interferometer images are directly comparable*

* The uncertainties in the identification of the *capsens* areas and in the images alignment are possibly responsible for systematic errors in the analysis of the subtraction residuals

Data Matching II

Comparison

AdOpt IF

Del Vecchio
et al.

Rationale

Background

Introduction

Images vs
Simulations

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

- take a 80 by 80 pixels area centered at the actuator locations (a grid of 5×5 actuators — the IF is practically flat outside this area); (*figure will follow*)
- $\mathbf{F}_c \text{ images} \ominus \text{ experimental data} = \text{difference map}$
- compute the RMS of the difference for each IF; (*figure will follow*)

Numerical
Approach

Interferometric
Data

Data Matching

Results

Summary

- 849 of 1170 actuators (colored dots)
 - $.011 \leq \text{RMS difference} \leq .043$
 - applied displacement = 1
 - $\approx 60\%$ of values is $\leq .02$
 - typical experimental data noise = .014
 - maximum values close to the edges
- 321 of 1170 actuators (black dots)
 - inner and outer DM edges
 - areas obscured by the spiders
 - some bad pixels

Results II

Detailing the Difference

The VLT displacement around actuator # 312

AdOpt IF
