COMSOL CONFERENCE 2015 BOSTON

Dr. Mária Csete COMSOL Conference, Boston, 2015

- SNSPDs are capable to detect a single-photon
 - Recovery time: <100 ns
 - Dark coundts: <100 1/s
 - Timing jitter: <100ps
- Application in Photonics, Quantum informatics and Astrology
- o Consist of
 - Meandered superconducting NbN wire
 - Different integrated nanostructures
 - Optical cavity array
 - Antenna array
 - Deflector array

- Two electrically connected crossed NbN patterns for polarization insensitive detection
- Spiral NbN pattern for polarization insensitive detection

 - Azimuthal orientation
 - Polar angle

The GLOBAL Optimization Algorithm

The bound constrained global optimization problem for which our stochastic algorithm was designed is

min f(x) $x \in X, X = \{a_i \le x_i \le b_i, i = 1, 2, ..., n\},\$ where f : $\mathbb{R}^n \to \mathbb{R}$ is an arbitrary real nonlinear function, X is the set of feasibility, an n-dimensional interval with vectors of lower and upper bounds of a and b, respectively. We applied the MATLAB version of the GLOBAL algorithm, a clustering stochastic global optimization technique. This method is capable to find the global optimizer points of moderate dimensional global optimization problems, when the relative size of the region of attraction of the global minimizer points are not very small.

The nonlinear constrained global optimization is

 $\begin{array}{l} \min f(x) \\ g(x) <= 0 \\ x \in X, X = \{a_i \leq x_i \leq b_i, i = 1, 2, \dots, n\}, \\ \text{where } g : \mathbb{R}^n \to \mathbb{R} \text{ is again an arbitrary real nonlinear function.} \end{array}$

In the latter case we used to apply the penalty approach for transformation to the above problem class. We add a nonnegative value proportional to how much the given condition was hurt, plus a fixed penalty term in case at least one of the properties was not satisfied.

 Geometry optimization to maximize contrast:

- NbN periodicity increase
- Cavity length increase
- Cavity width decrease
- Extended cavities are (<,<,>) $\lambda/4$
 - Wider cavity walls composing a narrow secondary cavity grating
- Absence of deflectors results in higher absorptance of ppolarized light and relatively high absorptance of spolarized light as well
- Symmetric profile and strongly depressed absorptance of ppolarized light
 - Effect appears in second BZ independent on the periodicity
