

# *Modeling of Wave Propagation in Particulate Composites*

*Phani Mylavarapu, Srivathsa Boddapati  
Defence Metallurgical Research Laboratory,  
Kanchanbagh*

# *Outline*

- Introduction
- Problem Definition
- FEM Modeling
- Approach
- Results and Discussions
- Conclusions and Future work

# Ultrasonic Testing

## • Attenuation

$$\frac{A}{A_0} = e^{-\alpha x}$$

$$\alpha = \alpha_s + \alpha_a + \alpha_r$$

E. Segal and J. L. Rose, in: Research Techniques in Non-Destructive Testing, Vol. IV, R. S. Sharpe (Ed.), pp. 275–316. Academic Press, London (1980).

## • Ultrasonic Velocity

- Longitudinal Velocity ( $V_l$ )  $L = \rho * V_l^2$
- Shear Velocity ( $V_s$ )  $G = \rho * V_s^2$

$$E = \frac{G(3L - 4G)}{L - G}$$

$$v = \frac{L - 2G}{2(L - G)}$$

# *Modulus Predicted from UT*

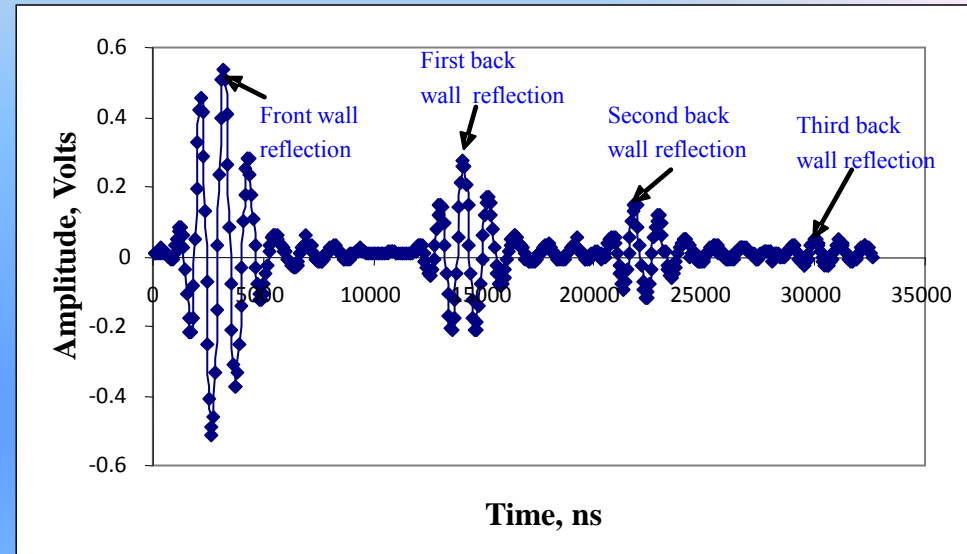

Sample Name	Predicted UI Modulus, MPa	SHPB Modulus, MPa	Quasi -Static Modulus, Mpa
Pure Epoxy	4476±183	4272-5084	2320±40
S2210	3667±89	3310-3903	2156
S2250	2173±41	1701-2244	1512
S3210	4071±45	3048-4099	2310
S3250	2800±88	2146-2808	2052
S3840	3481±25	3244-3664	2351
K4650	3385±109	2901-3446	2473

# *Cluster Interaction With Ultrasonic Energy*

# Problems with Ultrasonic Testing

- Difficult to distinguish the reflections originating from epoxy or particle or epoxy/particle interface
- Waves due to multiple reflections

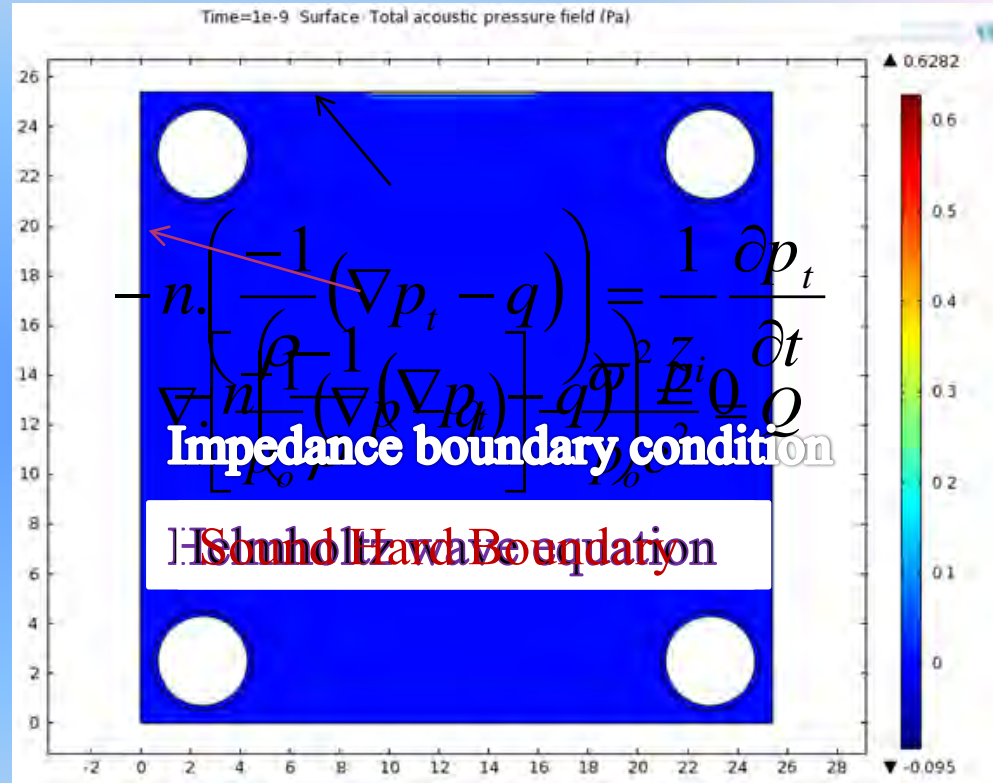

**S2230**

$$\frac{\lambda}{a} \gg 1 \quad \text{Typically UT performed}$$

$$\frac{\lambda}{a} = 1 \quad \& \quad \frac{\lambda}{a} < 1 \quad \text{Experimentally difficult}$$

# Modeling using COMSOL

- BC's available for source of excitation:
  - Gaussian point source
  - Pressure
  - Plane wave radiation
- BC's available for reflection/transmission between interfaces
  - Impedance

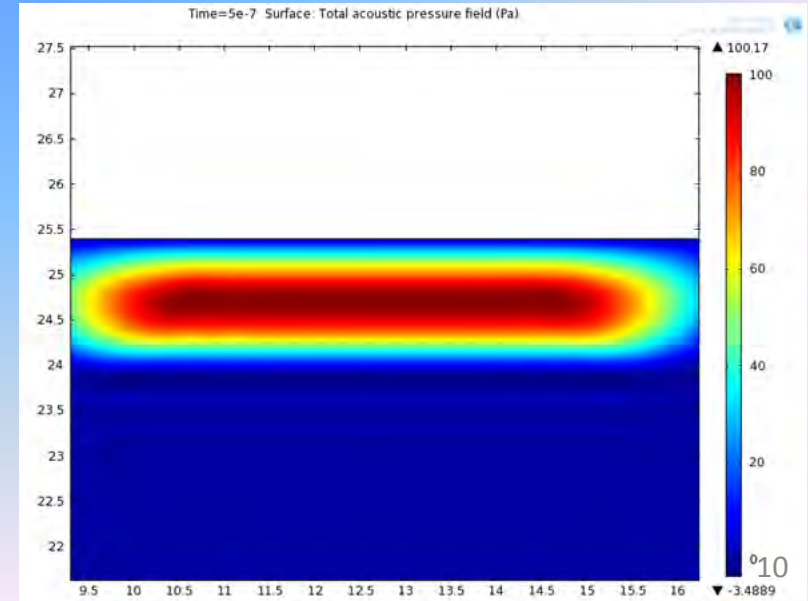

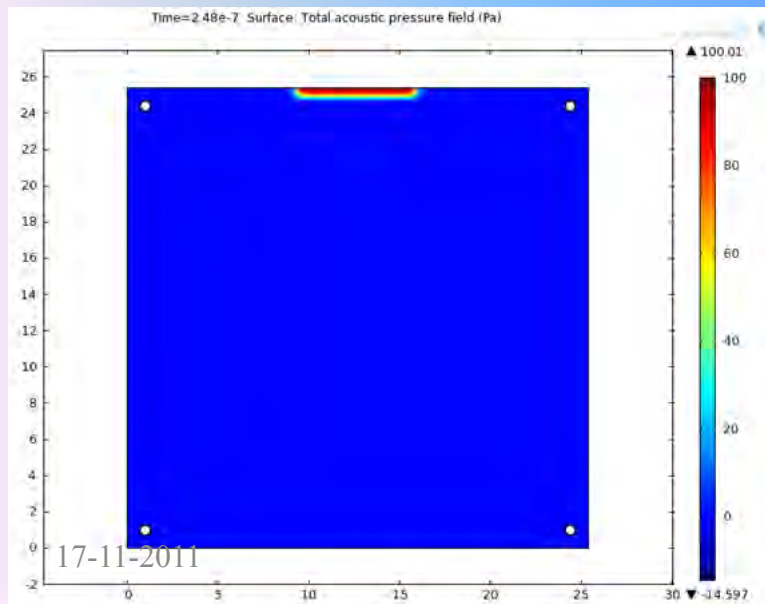

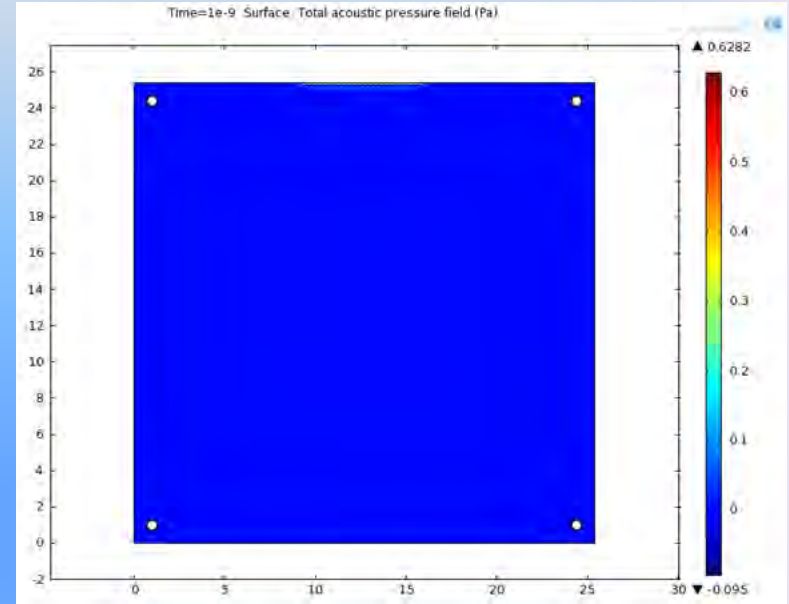

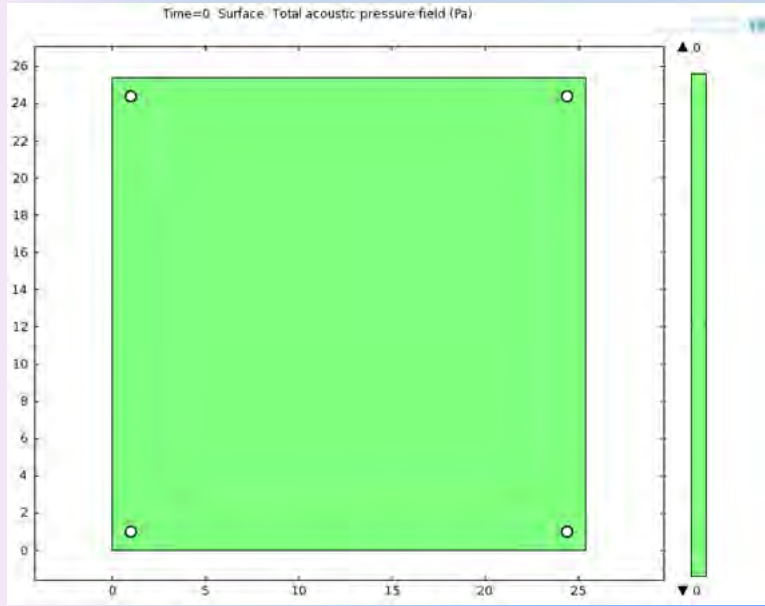

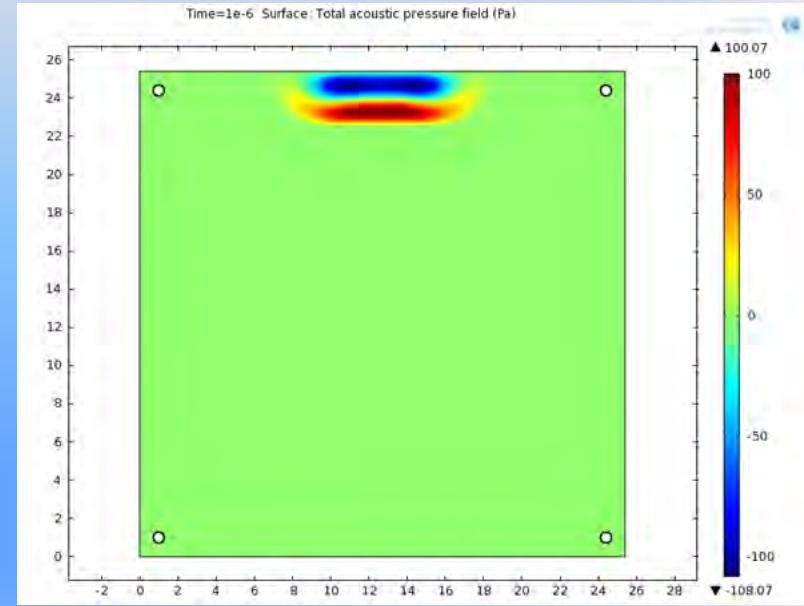

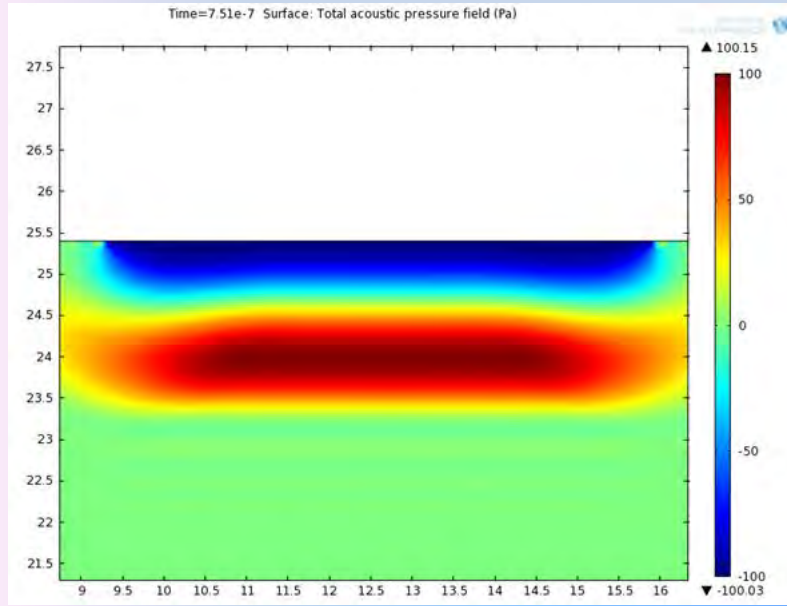

# *Mesh Details and CFL*

- 0.285 element size
- $\lambda/10$
- Same element size for all models
- CFL Criteria:  $5e-9$  s

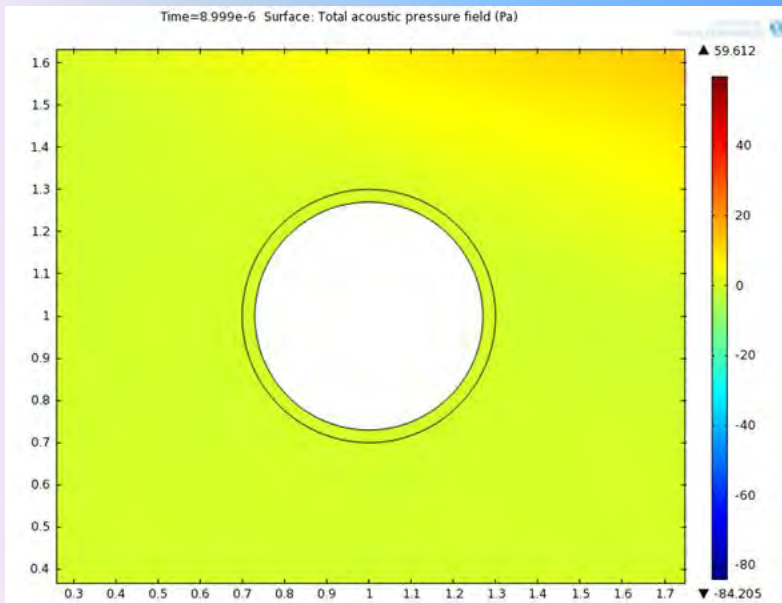

# Case 1: $\frac{\lambda}{a} \gg 1$

# Case 1 (contd...)

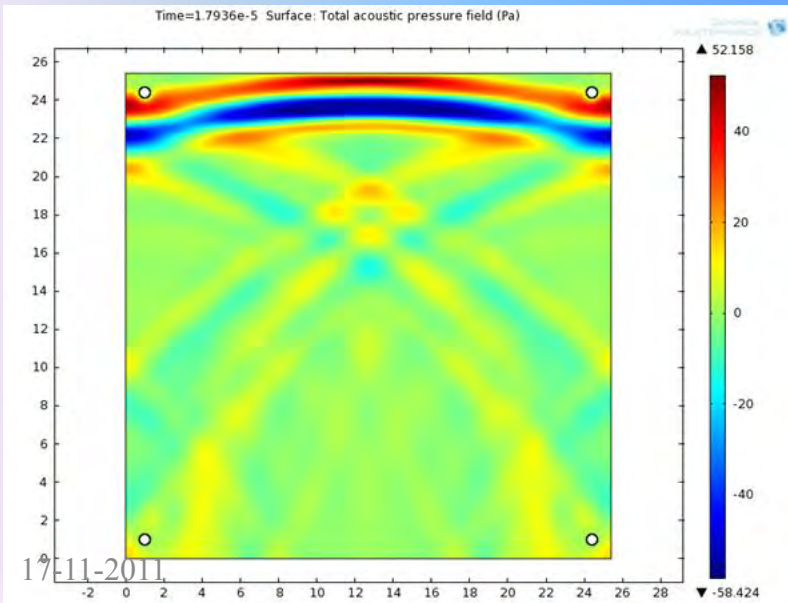

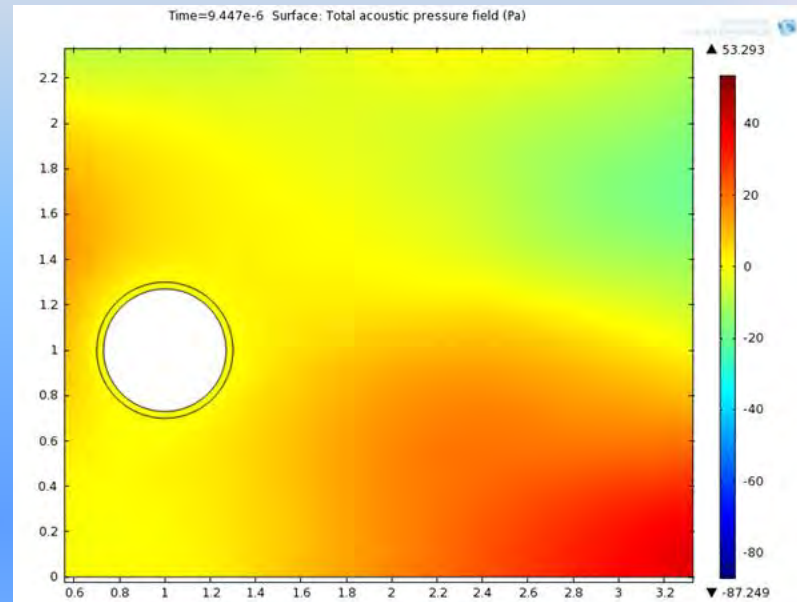

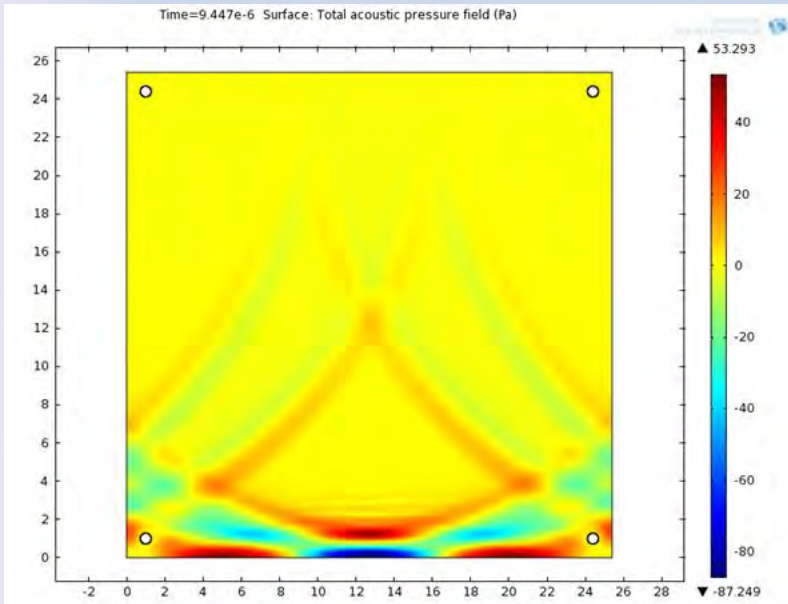

# Case 1 (contd...)

# Case 1 (contd...)

$$\frac{\lambda}{a} \ll 1$$

Surface: Total acoustic pressure field (Pa)

Time=7.926e-6 Surface: Total acoustic pressure field (Pa)

Time=8.053e-6 Surface: Total acoustic pressure field (Pa)

# Comparison of pressure in the particle

$$\frac{\lambda}{a} \gg 1$$

$$\frac{\lambda}{a} \ll 1$$

$$\frac{\lambda}{a} = 1$$

# *Conclusions and Future Work*

- Effect of ratio of wavelength to particle size on reflection studied.
- Ratios of less than, greater than and equal to 1.
- Multiple reflections from particles
